

Trace Semantics for Coalgebras: a Generic Theory

Ichiro Hasuo
Radboud University Nijmegen

January 24, 2006

Introduction

Introduction

Overview

Preliminaries I:
trace semantics

Preliminaries II: monads

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

- **Trace semantics** is defined for various non-det. systems:

- different input/output types,
- different “nondeterminism”: e.g. classical non-det. vs. probability.

- They are instances of one categorical construction:

coinduction in a Kleisli category

- Demonstrates the abstraction power of **category theory, coalgebras** in particular in computer science!

- Same mathematical principle hidden behind
- apparently different constructions

■ Main theorem

An initial algebra in **Sets** gives rise to

- an initial algebra, and also
- a final coalgebra,

in a Kleisli category $\mathcal{Kl}(T)$.

[Under some order-theoretic assumptions]

- Finality yields the **finite trace map**: in $\mathcal{Kl}(T)$,

$$\begin{array}{ccc} FX & \xrightarrow{\mathcal{Kl}(F)(\text{tr}_c)} & FA \\ \uparrow c & & \cong \uparrow J\alpha^{-1} \\ X & \xrightarrow{\text{tr}_c} & A \end{array} .$$

Limit-colimit coincidence
- Main technical result
- Application of the main
result
- Conclusions
and future work

- The proof of main result
(initial algebra-final coalgebra coincidence)
uses:
 - a classic result of limit-colimit coincidence in a suitably order-enriched setting
[Smyth & Plotkin, Siam J. Comput., '82]
- IH, Bart Jacobs and Ana Sokolova.
Generic Trace Theory.
To appear in CMCS'06.

Introduction

Introduction

Overview

Preliminaries I:
trace semantics

Preliminaries II: monads

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

- The result covers:
 - **I/O types** almost all polynomial F
 - **type of “nondeterminism”**:
 - **lift monad** $\mathcal{L} = 1 + _$
systems with **non-termination, exception**
 - **powerset monad** \mathcal{P}
(classical) non-deterministic systems
 - **subdistribution monad** \mathcal{D}
probabilistic systems

Introduction

Introduction

Overview

Preliminaries I:
trace semantics

Preliminaries II: monads

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

- The result is **generic**:
generalizing our previous papers
 - [IH & Jacobs, CALCO'05] $T = \mathcal{P}$
 - [IH & Jacobs, CALCO-jnr] $T = \mathcal{D}$
- Order-enriched structure is explicitly used for the first time.

Trace semantics

For (classical) non-deterministic systems,

trace = the set of all possible linear-time behavior

For

that is

$$\mathbf{tr}(y) = b^* = \{ \langle \rangle, b, bb, bbb, \dots \}$$

$$\mathbf{tr}(x) = (a + a^2 + a^3 + \dots) \cdot \mathbf{tr}(y)$$

$$= \{ a^{n+1} b^m \mid n, m \in \mathbb{N} \}$$

- Application of the main
result

- Conclusions
and future work

Another input/output type

Consider a **context-free grammar**.

- Terminal symbols: $0, s$
- Non-terminal symbol: T
- Generation rules:
 $T \triangleright 0$
 $T \triangleright sT$

From T , the following parse trees can be generated:

This is the “**trace**” of T .

Introduction

Preliminaries I:
trace semantics

Linear time-branching
time spectrum

Trace semantics

Another

“nondeterminism”

Another input/output
type

Summary

Preliminaries II: monads

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

A **trace** of (a state of) a non-det. system is:

- For **(classical) non-deterministic** systems,
the **set** of possible linear-time behavior
- For **probabilistic** systems,
the **probability distribution** over
possible linear-time behavior
- The **input/output type** specifies what is a
“linear-time behavior”.

and future work

Kleisli category $\mathcal{Kl}(T)$ for $T : \mathbb{C} \rightarrow \mathbb{C}$, a monad.

- Object

$$\frac{X \in \mathcal{Kl}(T)}{X \in \mathbb{C}}$$

- Arrow

$$\frac{X \xrightarrow{f} Y \text{ in } \mathcal{Kl}(T)}{X \xrightarrow{f} TY \text{ in } \mathbb{C}}$$

$$\frac{X \xrightarrow{f} Y \xrightarrow{g} Z \text{ in } \mathcal{Kl}(T)}{X \xrightarrow{f} TY \xrightarrow{Tg} T^2Z \xrightarrow{\mu_Z} TZ \text{ in } \mathbb{C}}$$

- Composition

$$\frac{X \xrightarrow{f} Y \xrightarrow{g} Z \text{ in } \mathcal{Kl}(T)}{X \xrightarrow{f} TY \xrightarrow{Tg} T^2Z \xrightarrow{\mu_Z} TZ \text{ in } \mathbb{C}}$$

- Id. arrow

$$\frac{X \xrightarrow{\text{id}} X \text{ in } \mathcal{Kl}(T)}{X \xrightarrow{\eta_X} TX \text{ in } \mathbb{C}}$$

Kleisli categories

- Introduction

- Preliminaries I:
trace semantics

- Preliminaries II: monads
 - Non-Det. systems as coalgebras
 - Monads
 - Kleisli categories
 - Distributive laws
 - Summary

- Preliminaries III:
Initial/final sequences

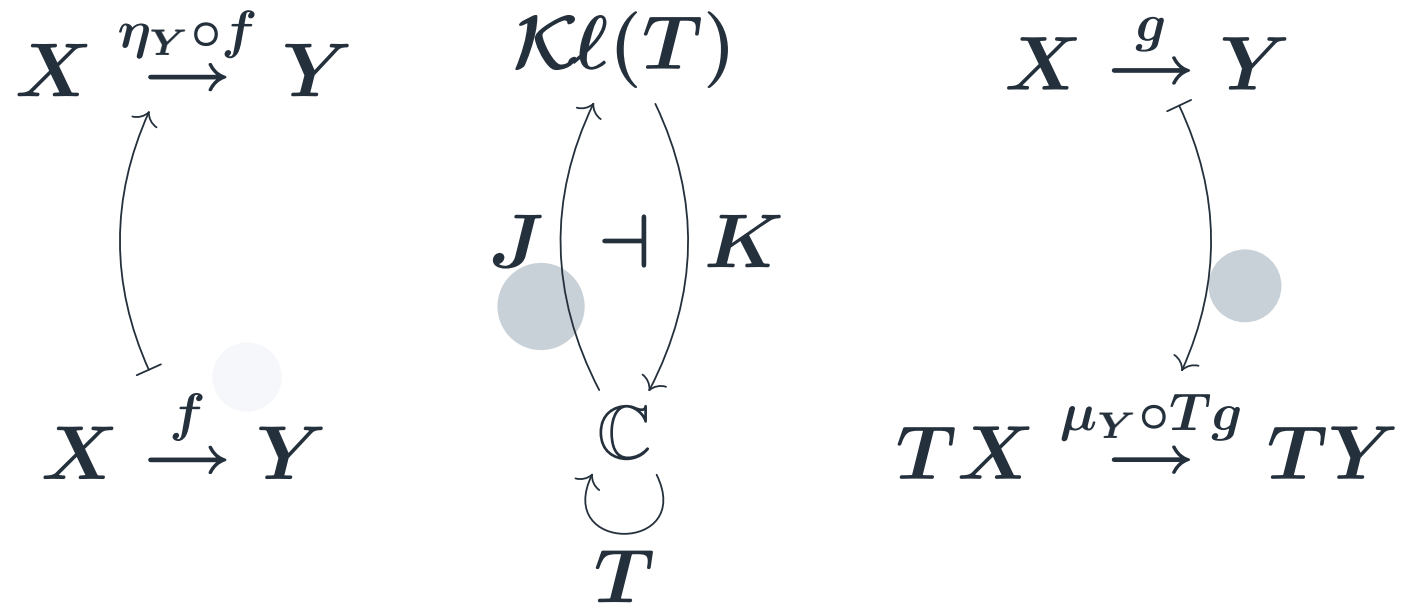

- Preliminaries IV:
Limit-colimit coincidence

- Main technical result

- Application of the main result

- Conclusions and future work

- Examples: $T = \mathcal{L}, \mathcal{P}, \mathcal{D}$. On the blackboard.
- There is an **adjunction**:

which yields the monad T .

- Moreover, this Kleisli adjunction is the initial one among those which yield T .

Distributive laws

- Introduction
- Preliminaries I: trace semantics
- Preliminaries II: monads
 - Non-Det. systems as coalgebras
 - Monads
 - Kleisli categories
 - Distributive laws
 - Summary

- Preliminaries IV: Limit-colimit coincidence
- Main technical result
- Application of the main result
- Conclusions and future work

Motivation

- A system of the form $\begin{array}{c} TX \\ \uparrow c \\ X \end{array}$ can be **iterated**:

In Sets

In $\mathcal{Kl}(T)$

- How about $\begin{array}{c} TFX \\ \uparrow c \\ X \end{array}$ which is of our interest?

Introduction

Preliminaries I:
trace semantics

Preliminaries II: monads

Non-Det. systems as
coalgebras

Monads

Kleisli categories

Distributive laws

Summary

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

- A **distributive law** is a natural transformation

$$\pi : FT \Rightarrow TF$$

which is compatible with the monad structure of T .

- It **swaps** T over F .
- The direction is opposite in [Bartels, PhD thesis], since:
 - Here the base category is Kleisli,
 - In [Bartels, PhD thesis] the base category is Eilenberg-Moore.
 - Duality in a suitable 2-categorical sense.

View in Sets

If a system $\begin{array}{c} TFX \\ \uparrow c \\ X \end{array}$ comes with a distributive law $\pi : FT \Rightarrow TF$, we can define n -th iteration of c :

$$\begin{array}{c} TF^n X \\ \uparrow c^n \\ X \end{array}$$

- Construction on the blackboard.
- Example: $T = \mathcal{P}$ and $F = 1 + \Sigma \times _$.

Distributive laws

- Preliminaries I: trace semantics

- Preliminaries II: monads
 - Non-Det. systems as coalgebras
 - Monads
 - Kleisli categories
 - Distributive laws
 - Summary

- Preliminaries III: Initial/final sequences

- Preliminaries IV: Limit-colimit coincidence

- Main technical result

- Application of the main result

- Conclusions and future work

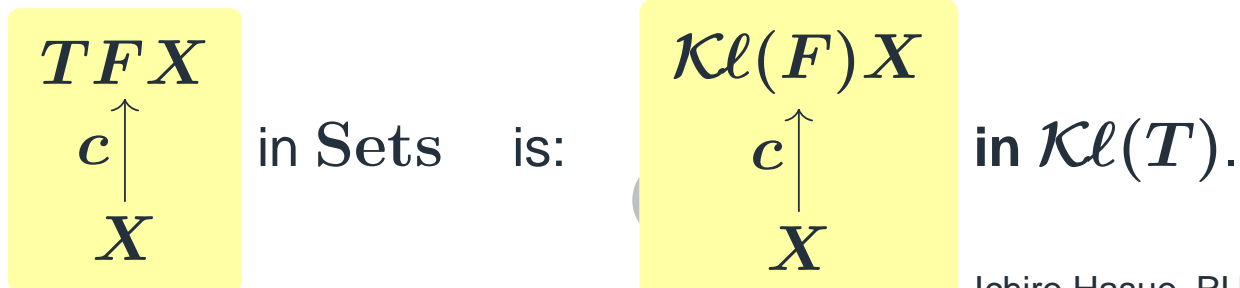

Another view, in $\mathcal{Kl}(T)$

- A distr. law $FT \Rightarrow TF$ lifts F

Construction on the blackboard.

- A system is now in the Kleisli category

Introduction

Preliminaries I:
trace semantics

Preliminaries II: monads

Non-Det. systems as
coalgebras

Monads

Kleisli categories

Distributive laws

Summary

Preliminaries III:
Initial/final sequences

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Application of the main
result

Conclusions
and future work

- A non-det. system is as a coalgebra

$$\begin{array}{c} TF X \\ \uparrow c \\ X \end{array}$$

- Its “nondeterminism” (suitable for trace semantics) is due to

- unit η** of T (“singleton”)
- multiplication μ** of T (“union”)
- distr. law $FT \Rightarrow TF$**

allowing for iteration of the system

$$\begin{array}{c} TF^n X \\ \uparrow c^n \\ X \end{array}$$

- We move to Kleisli category where the system is

$$\begin{array}{c} \mathcal{Kl}(F) X \\ \uparrow c \\ X \end{array}$$

result

Conclusions
and future work

- We sketch: generic construction of
 - initial F -algebra via **initial sequence**
 - final F -coalgebra via **final sequence**for $F : \mathbb{C} \rightarrow \mathbb{C}$.
- Assumptions are categorical.
For initial sequence construction,
 - existence of initial object $\mathbf{0} \in \mathbb{C}$;
 - existence of certain colimits in \mathbb{C} ;
 - F preserves such colimits.
- For illustration the example is $\mathbb{C} = \mathbf{Sets}$.
Later applied to $\mathbb{C} = \mathcal{Kl}(T)$.

Initial sequence

initial obj.

$$0 \xrightarrow{?} F0 \xrightarrow{F?} F^2 0 \xrightarrow{F^2?} F^3 0 \xrightarrow{F^3?} \dots$$

Initial sequence

Initial sequence

Assume: F preserves the upper colimit.

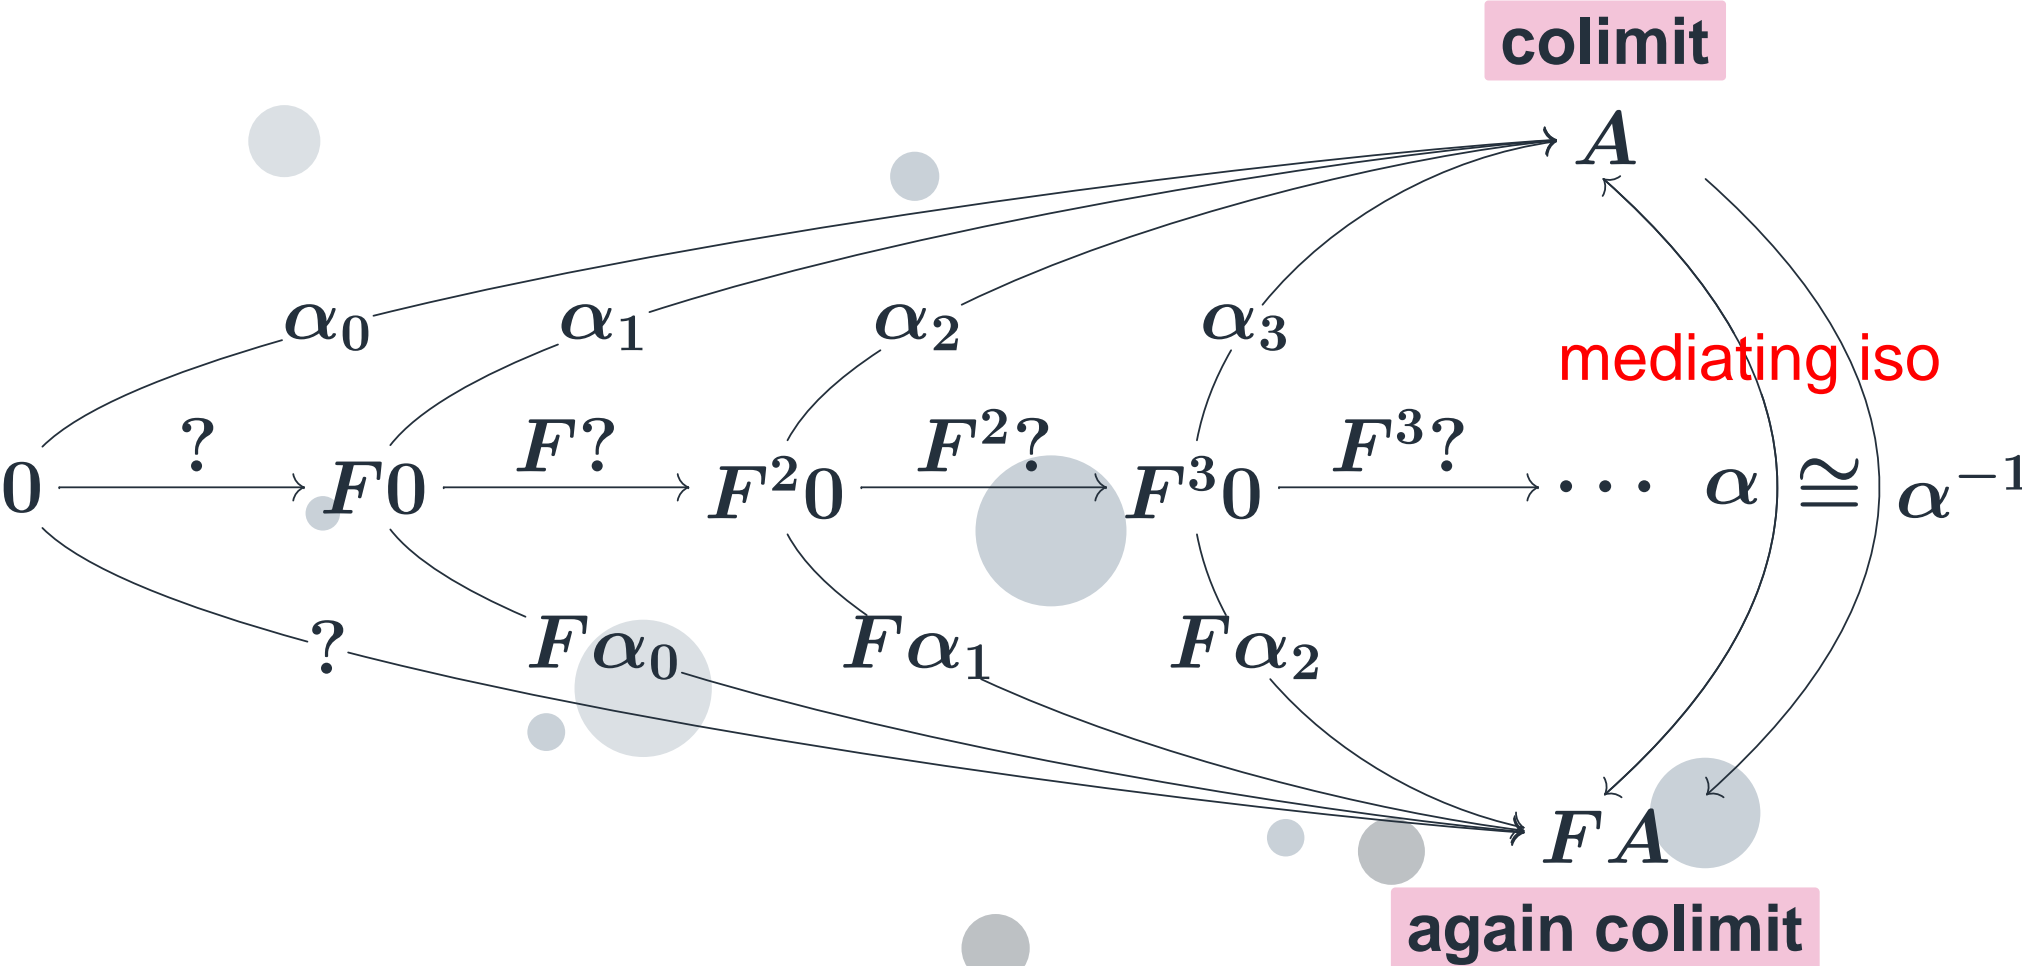

Initial sequence

Assume: F preserves the upper colimit.

Initial sequence

$\alpha : FA \xrightarrow{\cong} A$ is an initial algebra.

Initial sequence

Construction of f in

$$\begin{array}{ccc}
 FA & \xrightarrow{Ff} & FX \\
 \alpha \downarrow \cong & & \downarrow b \\
 A & \xrightarrow{f} & X
 \end{array}$$

■ $\begin{array}{c} FX \\ \downarrow b \\ X \end{array}$ induces a cocone over initial sequence:

$$\begin{array}{ccc}
 F^{n+1}0 & \xrightarrow{F\beta_n} & FX \\
 & \searrow \beta_{n+1} & \downarrow b \\
 & & X
 \end{array}$$

Initial sequence

Construction of f in

$$\begin{array}{ccc}
 FA & \xrightarrow{Ff} & FX \\
 \alpha \downarrow \cong & & \downarrow b \\
 A & \xrightarrow{f} & X
 \end{array}$$

Initial sequence, in Sets

$F = 1 + \Sigma \times _$, where $1 = \{\checkmark\}$ and $\Sigma = \{a\}$.

Question What is an initial algebra?

initial obj.

$$0 \xrightarrow{?} F0 \xrightarrow{F?} F^2 0 \xrightarrow{F^2?} F^3 0 \xrightarrow{F^3?} \dots$$

Initial sequence, in Sets

$F = 1 + \Sigma \times _$, where $1 = \{\checkmark\}$ and $\Sigma = \{a\}$.

initial obj.

$$\begin{array}{ccccccc} 0 & \xrightarrow{\quad ? \quad} & F0 & \xrightarrow{\quad F? \quad} & F^2 0 & \xrightarrow{\quad F^2? \quad} & F^3 0 & \xrightarrow{\quad F^3? \quad} & \dots \\ & & \parallel & & \parallel & & \parallel & & \\ & & 1 & & 1 + \Sigma & & 1 + \Sigma + \Sigma^2 & & \end{array}$$

Initial sequence, in Sets

$$F = 1 + \Sigma \times _, \quad \text{where } 1 = \{\checkmark\} \text{ and } \Sigma = \{a\}.$$

initial obj.

Initial sequence, in Sets

$F = 1 + \Sigma \times _$, where $1 = \{\checkmark\}$ and $\Sigma = \{a\}$.

Initial sequence, in Sets

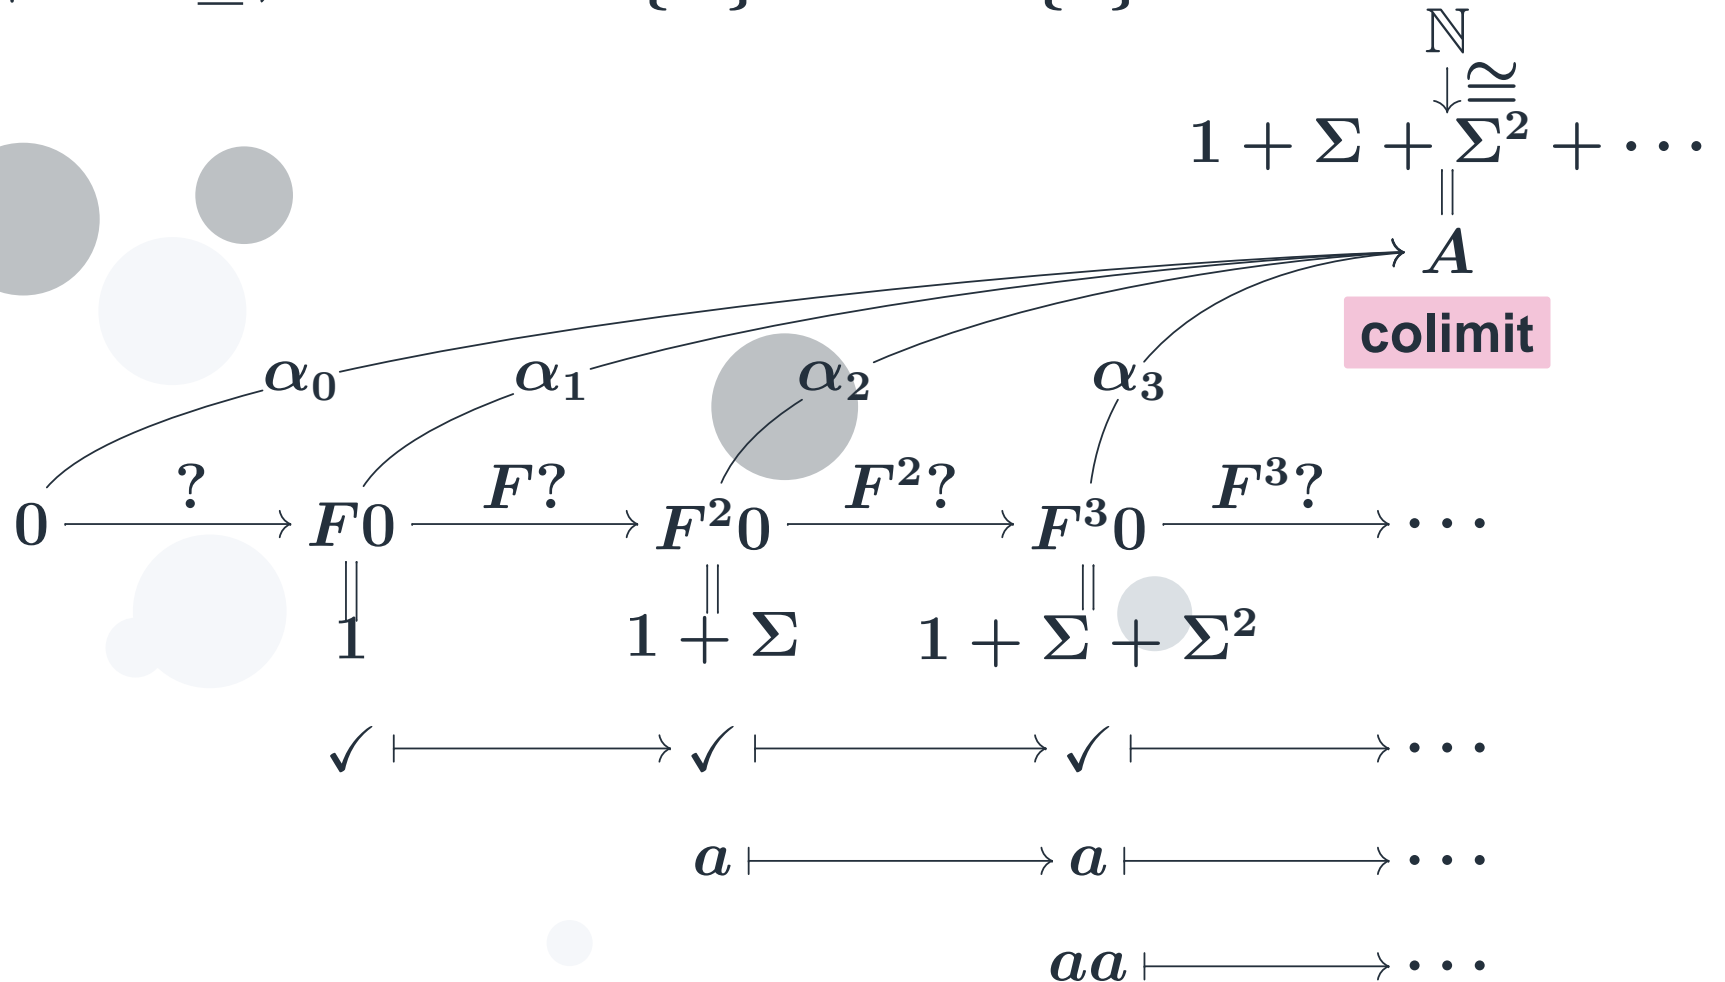

$F = 1 + \Sigma \times _$, where $1 = \{\checkmark\}$ and $\Sigma = \{a\}$.

colimit = $\left\{ \begin{array}{l} \text{coproduct, then} \\ \text{coequalizer} \end{array} \right\} \stackrel{\text{in Sets}}{=} \text{union}$

Initial sequence, in Sets

$F = 1 + \Sigma \times _$, where $1 = \{\checkmark\}$ and $\Sigma = \{a\}$.

$F^n 0 = \{\text{terms with depth} \leq n\}$

Final sequence

Dual of initial sequence...

Final obj.

$$1 \xleftarrow{!} F1 \xleftarrow{F!} F^2 1 \xleftarrow{F^2!} F^3 1 \xleftarrow{F^3!} \dots$$

Final sequence

Dual of initial sequence...

Final sequence

Dual of initial sequence...

Assume: F preserves the upper limit.

Final sequence

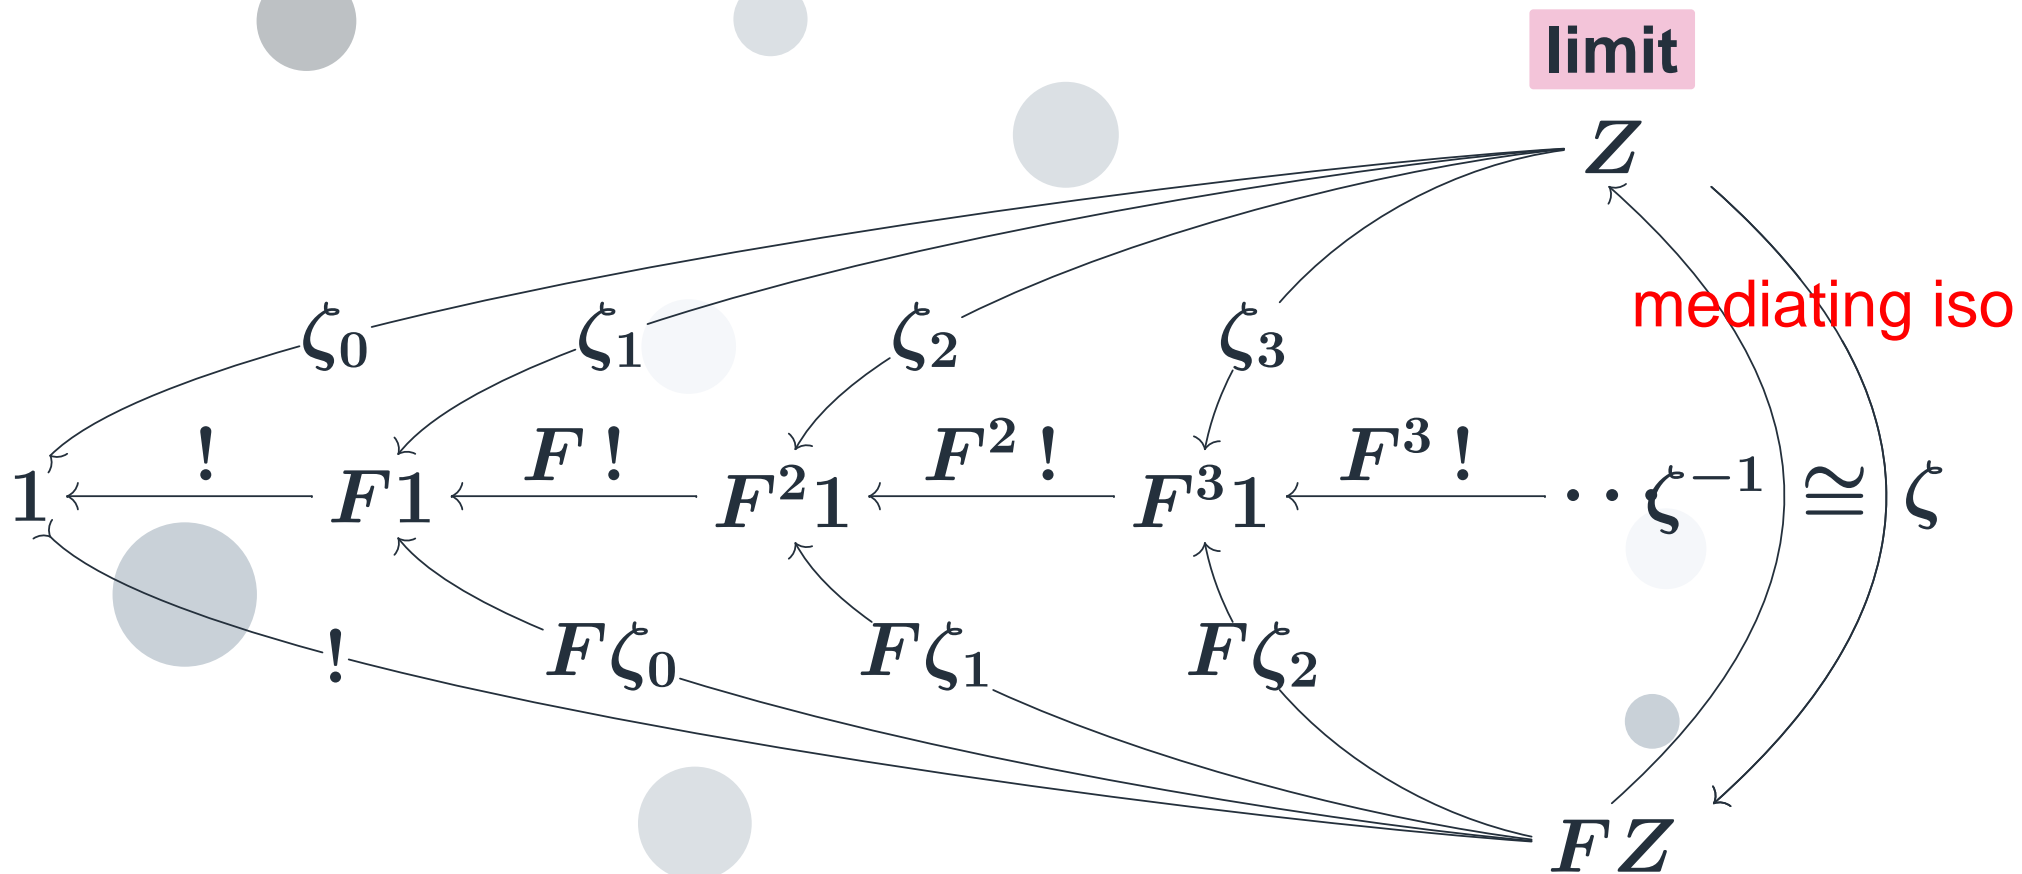

Dual of initial sequence...

Assume: F preserves the upper limit.

Final sequence

Dual of initial sequence...

$\zeta : Z \xrightarrow{\cong} FZ$ is a final coalgebra.

again limit

Conclusions
and future work

- Each homset is a dcpo:

- order between arrows $X \begin{array}{c} \sqcup \\ \sqcup \end{array} Y$ and
- supremum of increasing ω -chain:

- Composition preserves supremums:

$$X \begin{array}{c} \sqcup f_n \\ \vdots \end{array} Y \begin{array}{c} \sqcup g_n \\ \vdots \end{array} Z = X \begin{array}{c} \sqcup (g_n \circ f_n) \\ \vdots \end{array} Z$$

f_0 g_0 $g_0 \circ f_0$

- Examples: $\mathcal{Kl}(T)$ for $T = \mathcal{L}, \mathcal{P}, \mathcal{D}$ (on blackboard)

Embedding-projection pairs

In a **DCpo**-enriched category,

s.t. $\begin{cases} p \circ e = \text{id} & \text{and} \\ e \circ p \sqsubseteq \text{id} \end{cases}$

■ Diagrammatically,

■ e is mono and p is epi. Both are split.

■ $\begin{cases} p \text{ is the **smallest left-inverse** of } e \\ e \text{ is the **smallest right-inverse** of } p \end{cases}$

Hence corresponding emb./proj. is unique:
 (e, e^P) and (p^E, p) .

■ Intuition?

DCpo-enriched. Each e_n is an embedding.

DCpo-enriched. Each e_n is an embedding.

- Each α_n is also an embedding.

DCpo-enriched. Each e_n is an embedding.

- Each α_n is also an embedding.

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing.

DCpo-enriched. Each e_n is an embedding.

■ Each α_n is also an embedding.

■ $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing.

■ Its supremum is $A \xrightarrow{\text{id}} A$.

DCpo-enriched. Each e_n is an embedding.

colimit

- Each α_n is also an embedding.

Notion of O-colimit!

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing.
- Its supremum is $A \xrightarrow{\text{id}} A$.

Definition [O-colimit]

- Each α_n is an embedding.
- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing.
- Its supremum is $A \xrightarrow{\text{id}} A$.

Theorem [Smyth & Plotkin]

- An O-colimit is a colimit.
- Conversely, a colimit of $X_0 \xrightarrow{e_0} X_1 \xrightarrow{e_1} \dots$ is an O-colimit.

Definition [O-limit]

- Each β_n is a projection.
- $\{ A \xrightarrow{\beta_n} X_n \xrightarrow{\beta_n^E} A \}_{n < \omega}$ is increasing.
- Its supremum is $A \xrightarrow{\text{id}} A$.

Theorem [Smyth & Plotkin]

- An O-limit is a limit.
- Conversely, a limit of $X_0 \xleftarrow{p_0} X_1 \xleftarrow{p_1} \dots$ is an O-limit.

Limit-colimit coincidence

Theorem [Smyth & Plotkin]

DCpo-enriched. Each e_n is an embedding.

if and only if...

Limit-colimit coincidence

Theorem [Smyth & Plotkin]

DCpo-enriched. Each e_n is an embedding.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

- Colimit of ω -chain of embeddings consists of embeddings.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

O-colimit

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing and its supremum is $A \xrightarrow{\text{id}} A$.
- Colimit \iff O-colimit.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{\alpha_n} A \}_{n < \omega}$ is increasing and its supremum is $A \xrightarrow{\text{id}} A$.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{(\alpha_n^P)^E} A \}_{n < \omega}$ is increasing and its supremum is $A \xrightarrow{\text{id}} A$.
- $\alpha_n = (\alpha_n^P)^E$.

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

- $\{ A \xrightarrow{\alpha_n^P} X_n \xrightarrow{(\alpha_n^P)^E} A \}_{n < \omega}$ is increasing and its supremum is $A \xrightarrow{\text{id}} A$.
- Obvious duality between **O**-colimits and **O**-limits!

Proof: Limit-colimit coincidence

DCpo-enriched. Each e_n is an embedding.

■ Limit \iff O-limit.

■ Q.E.D.

Preliminaries IV:
Limit-colimit coincidence

Main technical result

Initial algebra-final
coalgebra coincidence

Proof: sketch

Proof: in detail

Application of the main
result

Conclusions
and future work

- Kleisli category $\mathcal{Kl}(T)$ is \mathbf{DCpo}_{\perp} -enriched.

- Each homset has the minimum:
$$X \begin{array}{c} \xrightarrow{f} \\ \sqcup \parallel \\ \xrightarrow{\perp_{X,Y}} \end{array} Y$$

- Composition in $\mathcal{Kl}(T)$ is **left-strict**:

$$X \xrightarrow{f} Y \xrightarrow{\perp_{Y,Z}} Z = X \xrightarrow{\perp_{X,Z}} Z .$$

- Lifted $\mathcal{Kl}(F) : \mathcal{Kl}(T) \rightarrow \mathcal{Kl}(T)$ is **monotonic**:

$$X \begin{array}{c} \xrightarrow{g} \\ \sqcup \parallel \\ \xrightarrow{f} \end{array} Y \implies FX \begin{array}{c} \xrightarrow{\mathcal{Kl}(F)(g)} \\ \sqcup \parallel \\ \xrightarrow{\mathcal{Kl}(F)(f)} \end{array} FY$$

- True for $T = \mathcal{L}, \mathcal{P}, \mathcal{D}$.

Proof: sketch

in Sets

- Initial sequence construction in **Sets**.

- Let's map by J in $\mathcal{Kl}(T) \rightarrow \mathbf{Sets}$.

Proof: sketch

in $\mathcal{Kl}(T)$

■ Mapped by J in $J \left(\dashv \right) K$.

$\mathcal{Kl}(T)$

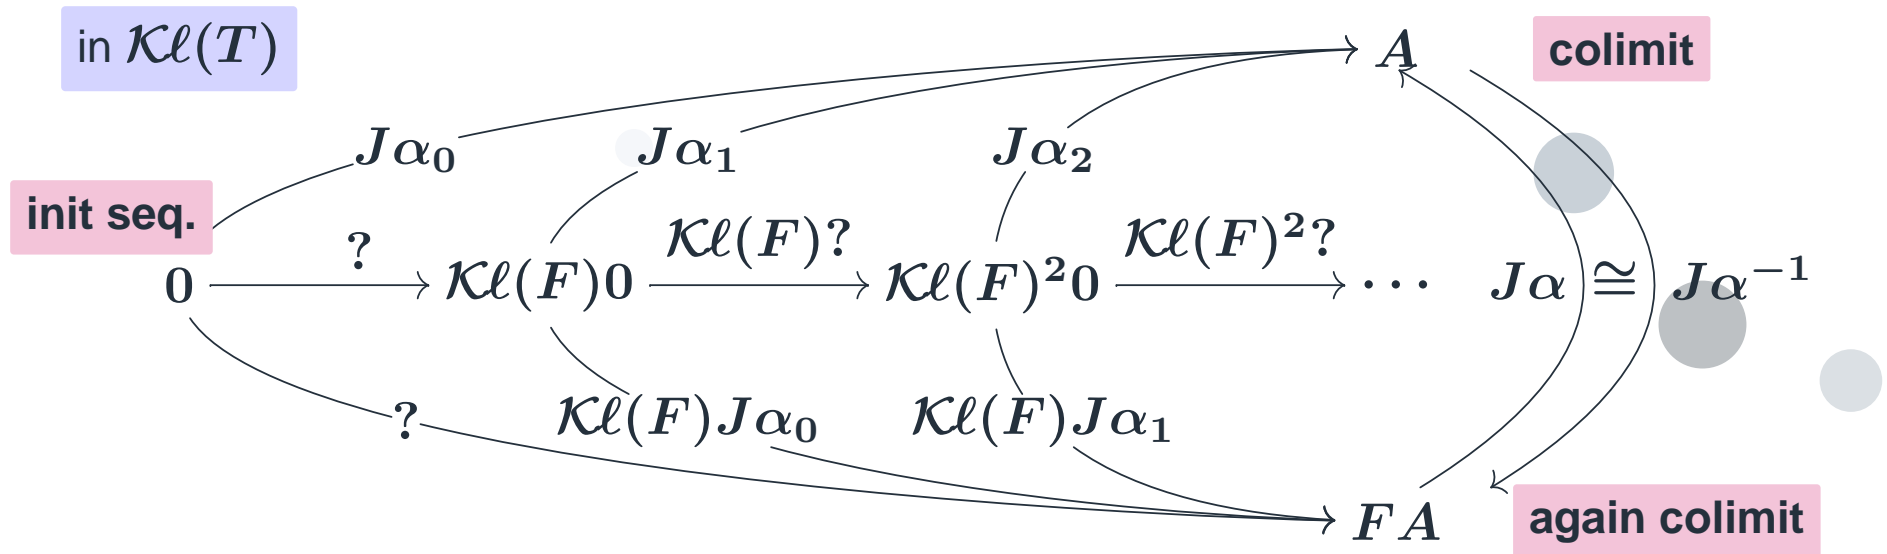

Sets

■ Left adjoint preserves colimits.

■ We shall show:

- The sequence is the initial sequence for $\mathcal{Kl}(F)$.
- The upper cone is mapped by $\mathcal{Kl}(F)$ to the lower one.

Proof: sketch

- This proves that $\begin{matrix} FA \\ J\alpha \downarrow \cong \\ A \end{matrix}$ is an initial $\mathcal{Kl}(F)$ -algebra.
- All arrows are embeddings. We take the corresponding projections.

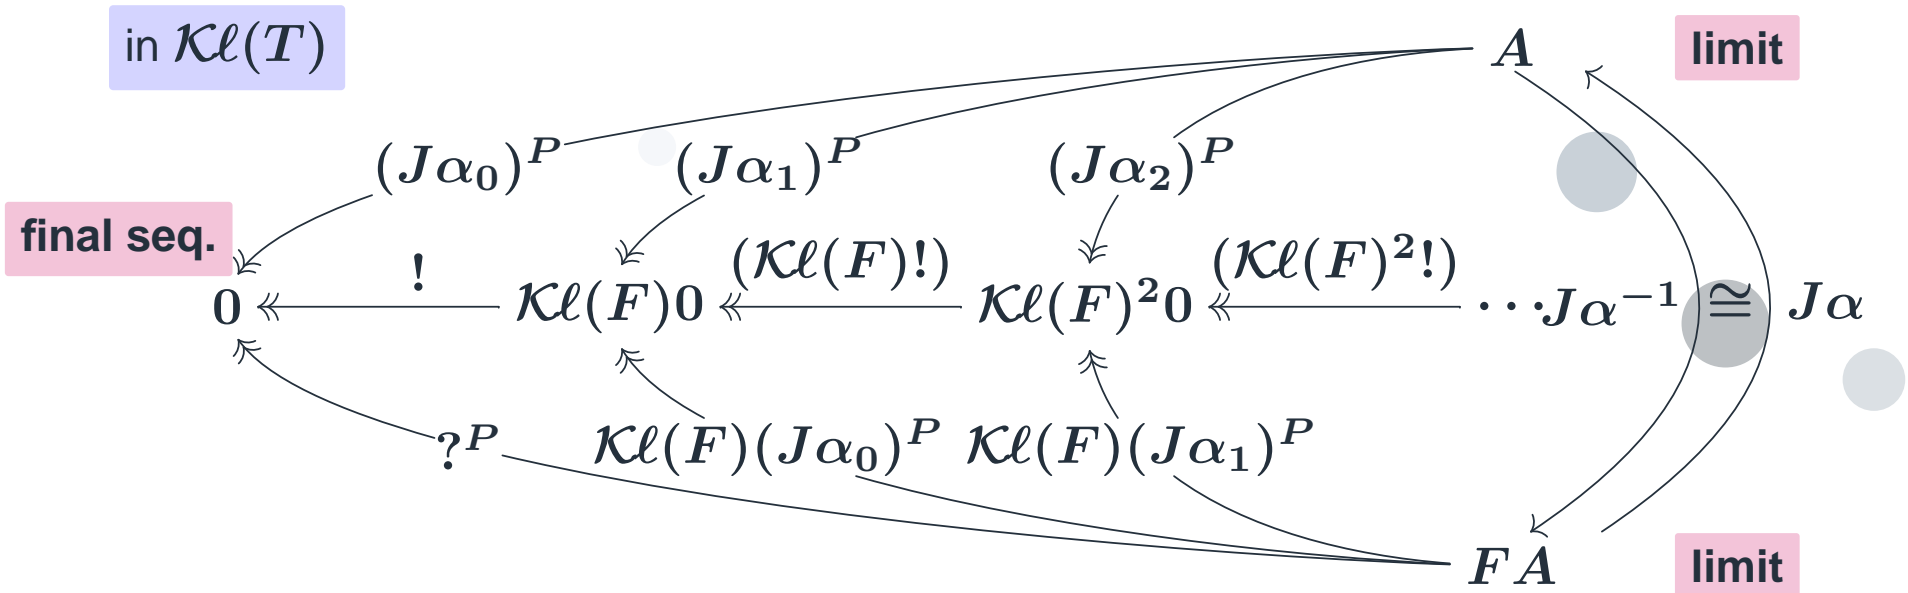

Proof: sketch

in $\mathcal{Kl}(T)$

- We used **Limit-colimit coincidence!**
- We show:
 - The sequence is the final sequence:
 - The upper cone is mapped by $\mathcal{Kl}(F)$ to the lower one.

Proof: sketch

- In a \mathbf{DCpo}_\perp -enriched category, an initial object is final as well.

- This proves that $J\alpha^{-1} \uparrow \cong \begin{matrix} FA \\ A \end{matrix}$ is a final $\mathcal{Kl}(F)$ -algebra. Q.E.D.

Proof: in detail

in Sets

- Initial sequence construction in **Sets**.

- Let's map by J in $\mathcal{Kl}(T)$ $J \left(\dashv \right) K$ in **Sets**.

Proof: in detail

in $\mathcal{Kl}(T)$

$\mathcal{Kl}(T)$

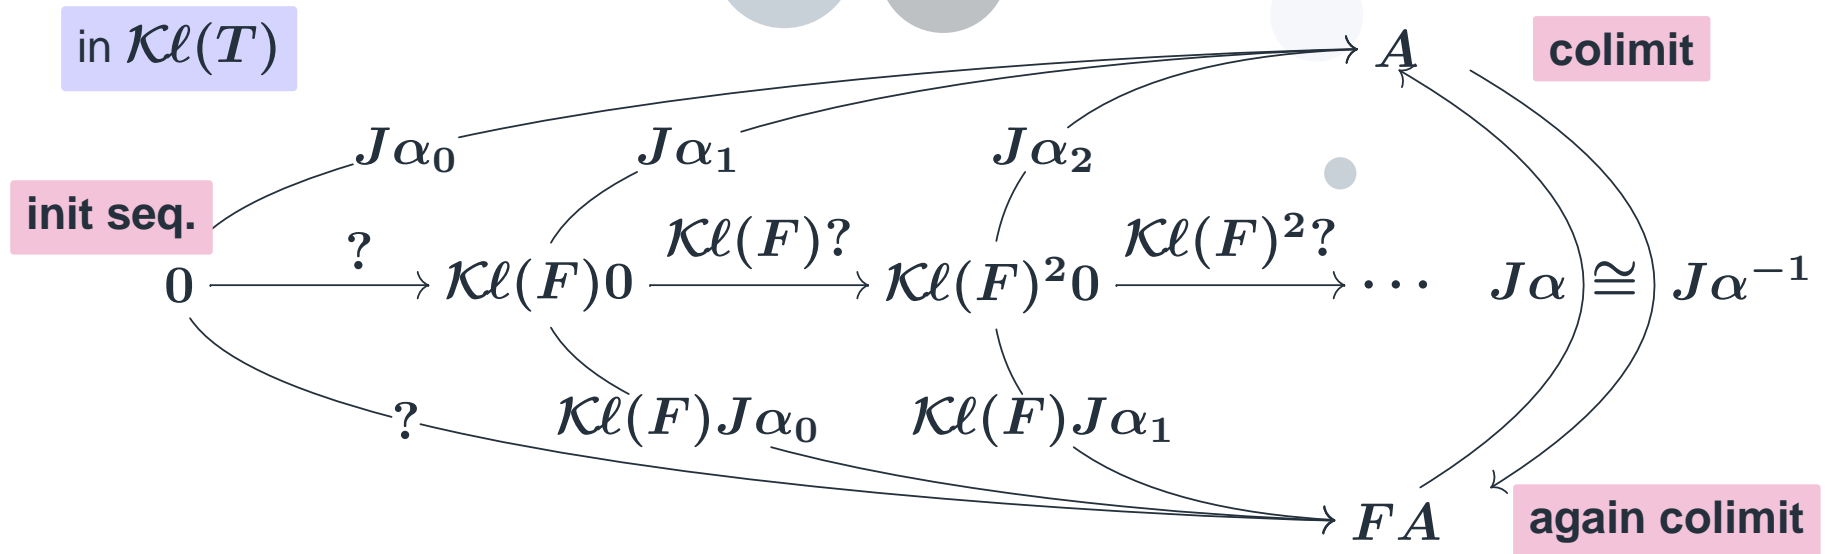

- Mapped by J in $J \left(\begin{array}{c} \uparrow \\ \dashv \\ \downarrow \end{array} \right) K$.
- Left adjoint preserves colimits.

Proof: in detail

in $\mathcal{Kl}(T)$

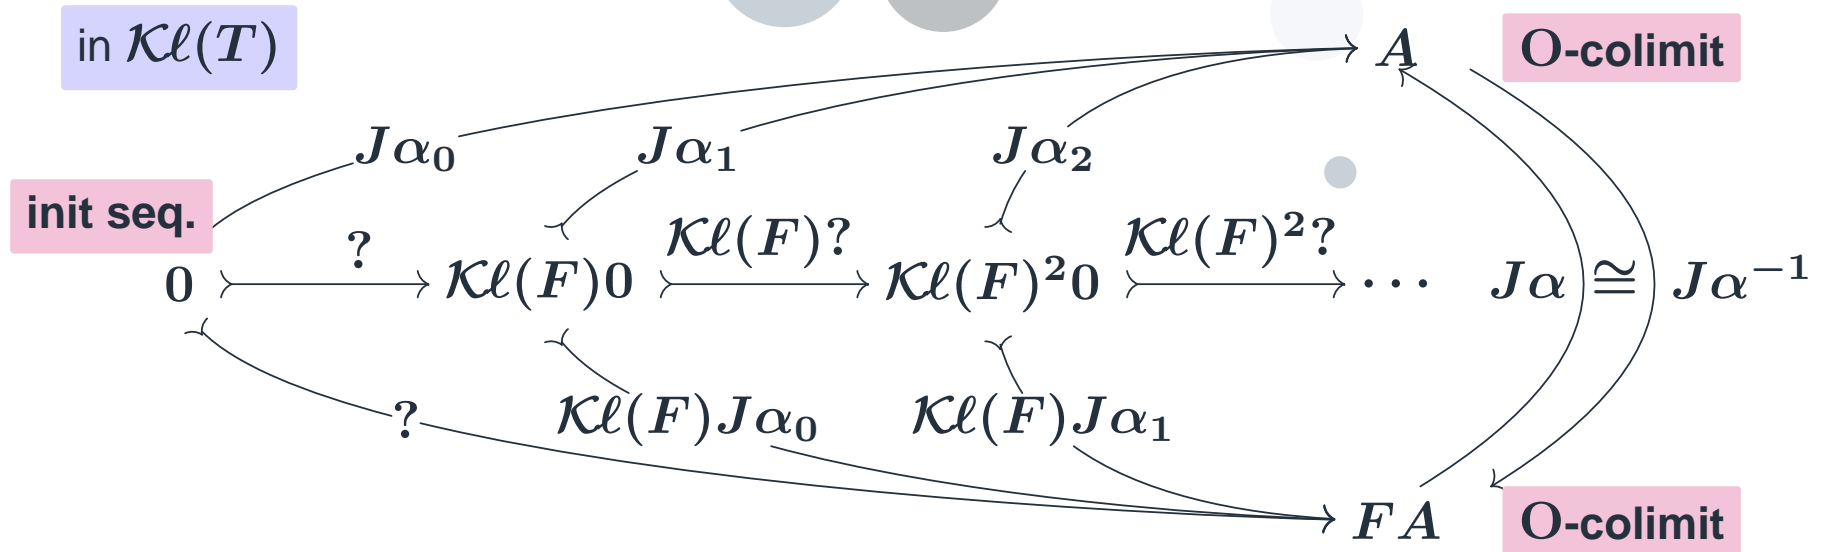

Proof: in detail

$$\begin{array}{ccc}
 \mathcal{Kl}(T) & \xrightarrow{\mathcal{Kl}(F)} & \mathcal{Kl}(T) \\
 J \uparrow & & \uparrow J \\
 \text{Sets} & \xrightarrow{F} & \text{Sets}
 \end{array}$$

■ This proves that $\begin{array}{c} FA \\ J\alpha \downarrow \cong \\ A \end{array}$ is an initial $\mathcal{Kl}(F)$ -algebra.

Proof: in detail

- Hence arrows in colimits are also embeddings.
- Colimits are \mathbf{O} -colimits.
- Let's take the corresponding projections...

Proof: in detail

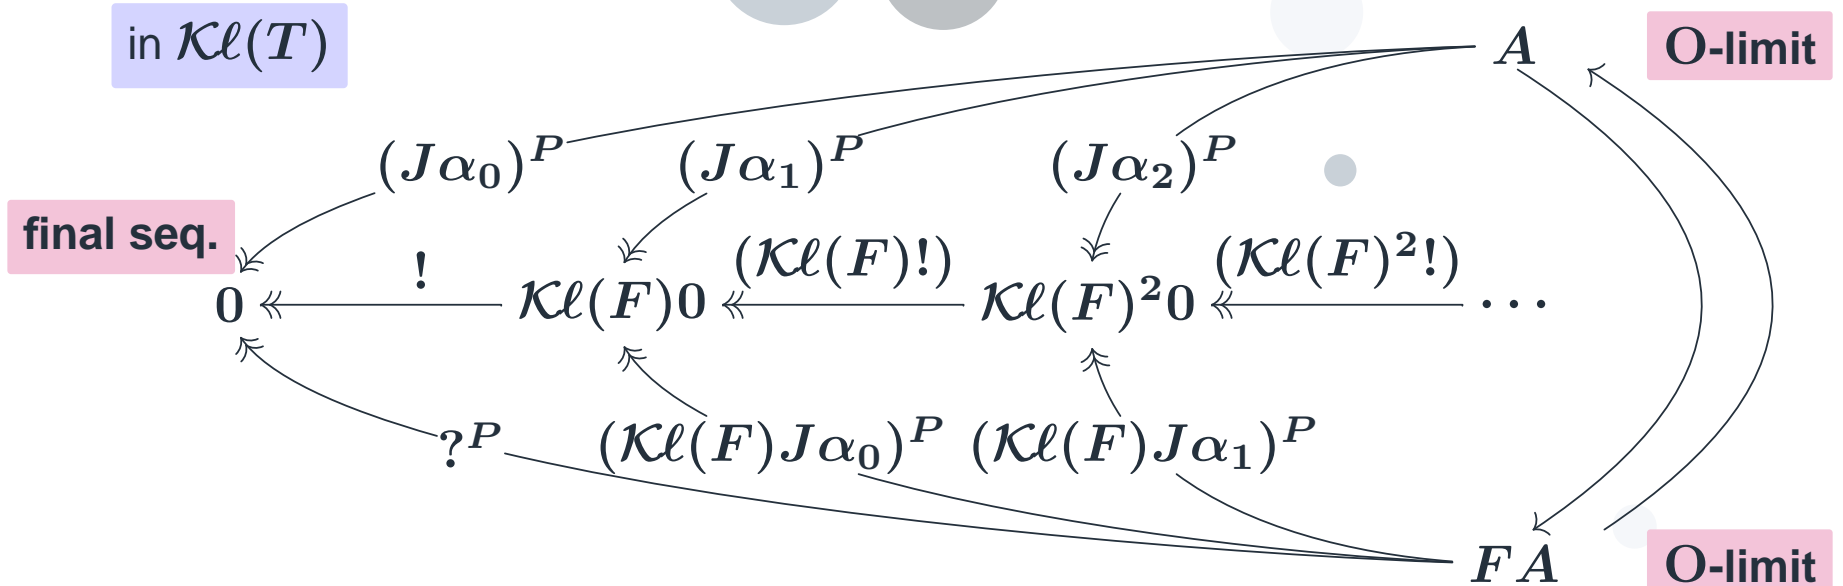

in $\mathcal{Kl}(T)$

■ We need to show:

- The sequence is the final sequence:
- The upper cone is mapped by $\mathcal{Kl}(F)$ to the lower one.

Proof: in detail

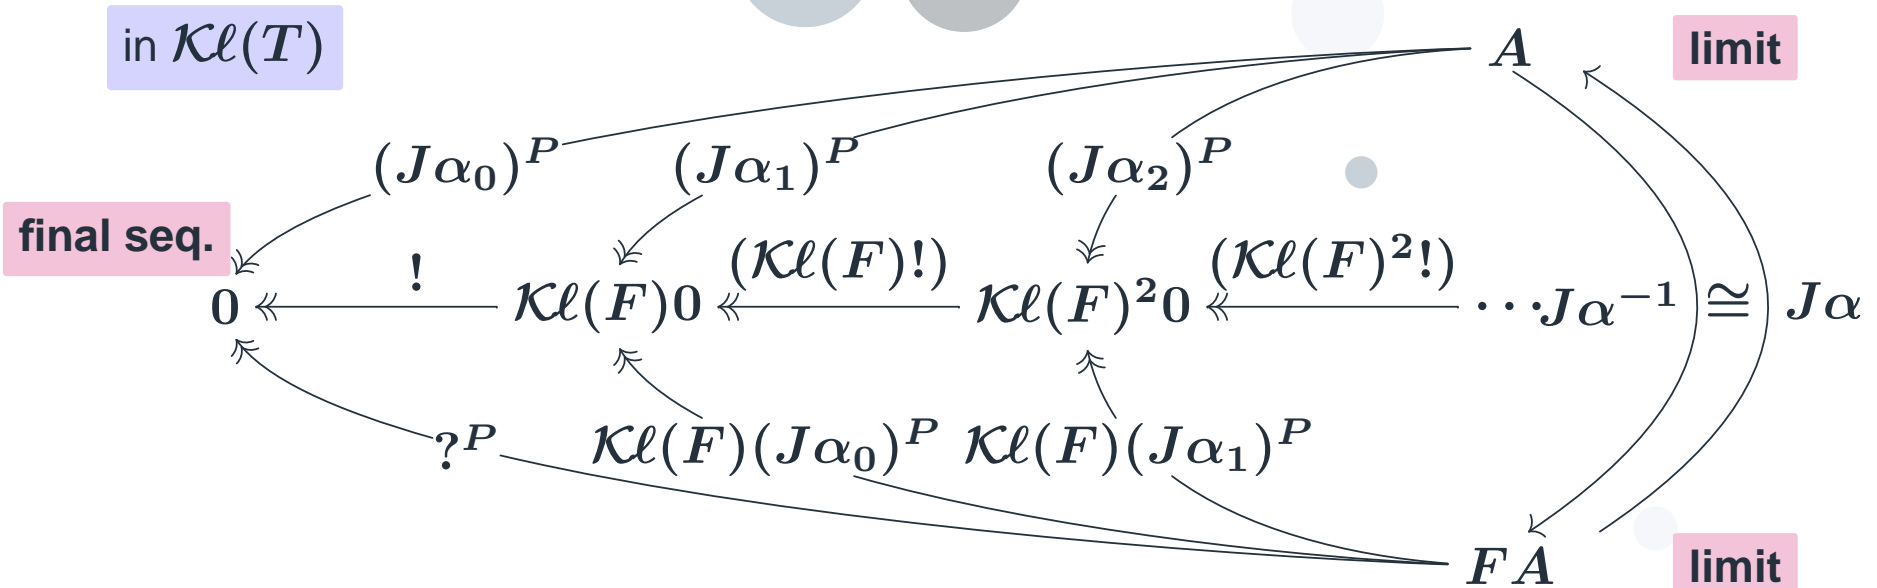

■ 0 is also final in $\mathcal{Kl}(T)$.

□ Existence $X \xrightarrow{\perp} 0$.

□ Uniqueness $X \xrightarrow{f} 0 = X \xrightarrow{f} 0 \xrightarrow{\text{id}} 0 = X \xrightarrow{f} 0 \xrightarrow{\perp} 0$
 $= X \xrightarrow{\perp} 0$.

Proof: in detail

■ O-limit \iff limit.

■ This proves that $\begin{array}{c} FA \\ J_{\alpha}^{-1} \uparrow \cong \\ A \end{array}$ is a final $\mathcal{Kl}(F)$ -algebra.

■ Q.E.D.
